

GreenGPT Advisory

Business Viability Assessment and 90-Day Growth Plan

A candid assessment of positioning, pricing, market fit, and the path to revenue.

Bottom line: Yes - GreenGPT Advisory can make money, but the likely path is expert-led diagnostics and managed compliance services first, with software serving as the delivery infrastructure.

Yes - but probably not in its current form

You can make money with GreenGPT Advisory because the underlying problem is real: companies need help tracking regulatory obligations, managing compliance evidence, and replacing fragile spreadsheet-based systems. Current EHS products explicitly sell compliance calendars, regulatory tracking, reminders, document management, and managed compliance services, so there is a demonstrated market.

However, the website currently looks like several businesses combined into one:

EHS compliance-calendar software

Managed EHS compliance services

Sustainability and ESG consulting

Green accounting

ISO 14001 consulting

AI chatbot

On-site construction HSE consulting

Training and executive briefings

That breadth makes it difficult for a buyer to understand exactly what you sell, who should buy it, and why they should act now.

My honest assessment

Area	Score
Business opportunity:	8/10
Your subject-matter credibility:	8/10
Current product positioning:	5/10
Website trust and conversion readiness:	4/10
Current distribution:	2/10
The lack of traction does not necessarily mean the product is bad. It means the current site is not yet supported by a focused, repeatable sales system.	

What is already good

The homepage has a stronger core message than many early-stage consulting sites:

"Know every EHS deadline before it finds you."

That identifies a real fear and a specific operational outcome. The site also explains useful differentiators:

Facility-specific obligations

Federal and state jurisdiction layering

Conditional hazard logic

Regulatory citations

Calendar exports

Deadline reminders

Managed program support

Those are commercially valuable capabilities. Industry offerings from VelocityEHS, Novara, Dakota Software and others emphasize essentially the same underlying need: centralizing obligations, deadlines, permits, evidence and regulatory tasks.

Your strongest potential differentiator is not merely "AI." It is:

An experienced EHS professional configures and maintains a site-specific compliance system for organizations that cannot justify a full-time compliance specialist or enterprise EHS platform.

That is much more credible and commercially useful than another general AI chatbot.

Why you are not getting traction

1. The brand identity is confusing

The domain is GreenGPT Advisory, but nearly every page identifies the company as The Green Executive Briefing. The logo is described as "Green Accounting," while the homepage sells EHS compliance software. The contact email uses a separate Bodii Brand domain.

To a buyer, that can look unfinished or like a side project.

Choose one public-facing identity:

GreenGPT Advisory

Managed EHS compliance systems for industrial facilities.

The Green Executive Briefing can remain the newsletter name, but it should not appear to be the name of the software and consulting company.

2. The services page is far too broad

The services page claims capabilities across:

Scope 1, 2 and 3 inventories

ISO 14001

CSRD

SEC climate rules

SASB

TCFD

GRI

NERC

LCA

EPDs

Net-zero planning

Climate-risk modeling

Circular economy

AI workflows

Executive advisory

A prospective client may reasonably wonder whether one early-stage firm can deliver all of these areas competently. Even where you technically could, buyers usually trust specialists more than generalists.

Your website should initially own one narrow category:

Managed EHS compliance for small and midsize industrial facilities.

Everything else should be secondary or removed.

3. The ideal customer is unclear

The site refers broadly to industries, states and facility hazards. That makes the addressable market seem large, but it weakens sales messaging.

You need a narrow initial ICP, such as:

U.S. manufacturers with 50–500 employees, one to five facilities, no dedicated regulatory-compliance system, and one overwhelmed EHS manager or operations leader.

Or even narrower:

Chemical, food-processing and industrial manufacturing facilities in New Jersey, New York, Pennsylvania and Connecticut.

Starting locally gives you regulatory familiarity, reachable prospects and the ability to conduct an initial site assessment.

4. The pricing does not match the implied service

The homepage offers:

Pro software: \$26 per month

Enterprise: \$149 per month

Enterprise includes a custom rule engine and quarterly review call

That pricing is inexpensive for software, but too low for meaningful expert review and managed compliance.

A genuine custom facility obligation assessment can require hours of:

Permit review
 Regulatory applicability analysis
 Hazard-profile validation
 State-program analysis
 Deadline configuration
 Documentation review
 Human quality control

You cannot profitably deliver substantial expert work for \$149 per month unless the client is nearly entirely self-service.

Competitors and adjacent services illustrate the range: generic entry-level EHS software may begin at low monthly prices, while managed compliance programs can start in the thousands of dollars per site annually. One current environmental compliance program publicly lists pricing beginning at \$4,000 per site per year.

5. There is not enough credible proof

The homepage displays testimonials attributed to an EHS director at a Texas chemical manufacturer and a VP of Operations at a multistate food processor.

If these are real clients, you need stronger proof:

Company name or clearly explained anonymization
 Actual before-and-after result
 Specific engagement scope
 Screenshot or sample deliverable
 Permission-based quote
 Case study

If they are illustrative placeholders, remove them immediately. Unverified testimonials can destroy trust.

The projects page describes general HSE responsibilities but does not show a customer problem, what you delivered, or a measurable outcome.

6. You are asking visitors to buy before demonstrating the result

"Generate my calendar" is a good product-led entry point, but regulatory calendars are sensitive. Buyers will want to understand:

Which jurisdictions are supported
 Which regulations are covered
 When the rule database was last reviewed
 Who validates applicability
 How errors are corrected
 What the customer remains responsible for
 Whether permits and consent orders are included

How confidential documents are protected

The website currently says the regulatory engine generates the calendar and differentiates itself from ordinary ChatGPT, but the visible page does not provide enough validation detail for a serious EHS buyer.

The business model I would use

Do not initially try to win through a \$26 software subscription. Sell a productized managed service, with the software supporting delivery.

Offer 1: Compliance Diagnostic

Price: \$750–\$1,500 per facility

Deliver:

Facility applicability questionnaire

Preliminary federal and state obligation register

12-month compliance calendar

Top 10 potential gaps

60-minute findings review

Recommended implementation plan

This is easier to buy than an indefinite subscription and gives you a paid entry point.

Offer 2: Managed EHS Compliance

Price: approximately \$750–\$2,000 per month per facility

Deliver:

Maintained obligation register

Monthly compliance briefing

Calendar and deadline monitoring

Permit and reporting tracker

Draft inspection and reporting materials

Corrective-action tracking

Quarterly program review

Human review by an EHS professional

The exact price should depend on facility complexity, permits, jurisdictions and employee count.

Offer 3: Custom EHS AI Workspace

Setup: \$3,000–\$10,000

Ongoing: \$500–\$2,000 per month

Deliver:

Client-approved document library

Source-grounded AI assistant

Inspection and audit workflows

Corrective-action workflows

Facility-specific procedures and forms

User training

Periodic source and configuration review

The value is not access to an AI chat screen. The value is the configuration, source control, workflow design, governance and professional review.

What I would change on the homepage

Your homepage should communicate one buyer, one problem and one offer.

Proposed positioning

Headline

Never miss another EHS compliance obligation.

Subheadline

GreenGPT Advisory builds and manages facility-specific compliance calendars, obligation registers and audit-ready workflows for manufacturers without large in-house EHS teams.

Primary CTA

Request a Facility Compliance Diagnostic

Secondary CTA

View a Sample Compliance Briefing

Then immediately show:

Who it is for

What the client receives

A sample deliverable

How human review works

Supported industries and jurisdictions

Starting price

Founder credentials

One real case study

Scheduling link

Remove the generic sustainability language from the primary path.

Your next 90 days

Weeks 1-2: Narrow and rebuild the offer

Pick one ICP.

Remove unrelated service categories.

Unify branding under GreenGPT Advisory.

Create one paid diagnostic.

Create one sample obligation register.

Create one sample monthly briefing.

Create one two-page case study from work you are legally permitted to discuss.

Clearly state that final applicability determinations are human-reviewed.

Weeks 3–6: Direct outreach

Build a list of approximately 200 facilities, not 200 random companies.

Target:

EHS managers

Plant managers

Operations directors

Facility managers

Regional safety directors

Private-equity operating partners with industrial portfolios

Send personalized messages referencing a probable operational problem:

Multiple facilities

No obvious EHS staff

Recent expansion

Regulatory permit complexity

New plant

Acquisition

Open EHS position

Reliance on spreadsheets

Your goal is not to sell software in the initial message. It is to obtain a short conversation about how the facility currently tracks obligations.

Weeks 7–12: Sell pilots

Offer three to five companies a tightly scoped paid pilot:

One facility

One state

30-day setup

Fixed price

Defined deliverables

Written feedback and testimonial permission

Do not give the full service away for free. A discounted paid pilot produces more reliable validation than free users.

Numbers that would validate the business

Over the next three months, target:

200 highly targeted prospects

40 meaningful conversations

12 discovery calls

5 proposals

2 paid pilots

If you contact 200 properly selected prospects and cannot produce at least several qualified calls, then either:

The ICP is wrong

The problem is not urgent enough

The message is unclear

The buyer does not trust the delivery model

The offer requires repositioning

One discovery call is not enough data to conclude that the business cannot work. It is enough data to conclude that the current customer-acquisition process is not working.

My verdict

Yes, you can make money with it.

But the likely path is not:

Build website -> wait for traffic -> collect \$26 subscriptions.

It is:

Sell expert-led compliance diagnostics -> convert them into managed-service contracts -> use the software to deliver faster and more consistently -> gradually turn repeatable components into scalable software.

Your EHS experience is the current product. The software is the delivery infrastructure. Once clients repeatedly pay for the outcome, then you can determine which pieces deserve to become a standalone SaaS platform.
